

CONSTANT-VOLTAGE/CURRENT POWER SUPPLY

PD18-10(D) PD35-10(D)

SERVICE MANUAL_{REVISED EDITION}

KENWOOD CORPORATION

(EX. PD18-10)

WARNING

The following instructions are for use by qualified personnel only. To avoid electric shock, do not perform any servicing other than contained in the operating instructions unless you are qualified to do so.

SAFETY

Before connecting the instrument to a power source, carefully read the following information, then verify that the proper power cord is used and the proper line fuse is installed for power source. If the power cord is not applied for specified voltage, there is always a certain amount of danger from electric shock.

Line voltage

This instrument operates using ac-power input voltages that 100/120/220/240 V at frequencies from 50 Hz to 60 Hz.

Power cord

The ground wire of the 3-wire (for 120 V operation; 2-wire) ac power plug places the chassis and housing of this instrument at earth ground. Do not attempt to defeat the ground wire connection or float this instrument; to do so may pose a great safety hazard.

The appropriate power cord is supplied by an option that is specified when the instrument is ordered.

Warning

If groundings, especially points \downarrow (V_G) and \downarrow (I_G), are short-circuited during servicing, it could lead to pattern damage due to large amount of current flow on the PCB. Take appropriate care.

BLOCK DIAGRAM

CIRCUIT DESCRIPTION

DESCRIPTION OF BLOCK DIAGRAM

1. Voltage selector and surge absorber.

Selects rated input voltage and limits external noise.

2. Power switch (circuit protector)

This function as a power switch, and breaks the power supply in event of an accident in the power source.

3. Power transformer

Provides auxiliary windings to operates the main and accessory circuits in the transformer.

4. SCR control rectification circuit

A rectification circuit to control the DC level synchronized with AC, with the gate pulse from the phase control circuit.

5. L, C smoothing circuit

Averages the rectified output from the choke coil and capacitor. The choke coil limits transient current for a high power factor and low ripple.

6. Phase control circuit

Generates a trigger pulse AC synchronized with the SCR control rectification circuit to maintain the V_{CE} of the series transistors at a constant voltage.

7. Series control circuit

Used to control high output with a small signal by Darlington connecting the high output power transistor.

8. Current detecting circuit

A stable detection voltage is obtained by effecting adequate derating, using resistor with a low temperature factor.

9. Voltage detecting circuit

A stable detection voltage is obtained using a highly precise metal oxide film resistor with a low temperature factor.

10. CC error (differential) amp

A highly precise amplifier which uses a high-gain, low-drift OP Amp and compares output from the current detecting circuit with the current reference voltage.

11. CV error (differential) amp

A highly precise amplifier which uses a high-gain, low-drift OP Amp and compares output from the voltage detecting circuit with the voltage reference voltage.

12. OR circuit

Selects automatically one (using) the OR circuit from the CV or CC amp depending on output and setting.

13. Circuit power source

Supplies regulated DC voltage to operate the control circuit and provides a protection function.

14. Voltage reference circuit

This circuit is within the control power source feedback loop, and stably drives the temperature compensation zener diode.

15. Current reference circuit

Drives the temperature compensation zener diode using the constant current circuit to provide a stable output.

16. OVP circuit

Detects output voltage within a range of 15%-110% of the rated output voltage, according to the external overvoltage setting.

17. Overcurrent detecting circuit

Detects when the current reaches a level of 125% of the rated current, using the signal from the current detecting circuit.

18. Temperature detecting switch

Detects when the heat sink of series transistor becomes 100 °C with the thermal relay.

19. Constant-current circuit

A discharge circuit for series transistor leakage current and the output capacitor.

20. Circuit protector drive circuit

Drives the protector with the signals that come from the respective detecting circuits. It provides a constant and discharge circuit to minimize influence from small noise, etc.

21. Meter amp

Selects output voltage, voltage or reference voltage with the V/I, OUTPUT and OVP and passes it through the buffer amp to provide stabilized meter output.

CIRCUIT DESCRIPTION

1. MAIN POWER SOURCE (X81-1590)

The AC input voltage is rectified by D1-D3, and the output smoothed by the choke coils T2 and C1. The thyristors D1 and D2 are controlled in the phase control circuit. The rectified voltage goes through the series control transistors Q1, 3, 5 and current detecting resistor R10, and is supplied to the output +OUT terminal. The -OUT terminal goes through D6 and returns to the rectification circuit.

2. REFERENCE VOLTAGE CIRCUIT (X73-1670), (X73-1680)

This circuit generates the control circuit power source and a variable reference voltage for voltage and current (V_{ref} , I_{ref}). The AC voltage is rectified by D1 and, a constant voltage of ± 15 V is generated in the constant voltage circuit which consists of Q1-Q8, U1 and D14.

The reference voltage of ± 15 V is generated by the zener diode D14.

-15 V is generated by the error amplifier U1 (1/2), reference voltage (D14) and the dividing resistors R20 and R21.

+15 V is generated by the error amplifier U1 (2/2) and dividing resistors R9 and R10.

The GND of the ± 15 V is indicated by $\downarrow V_G$ on the circuit diagram, and is connected to the +OUT terminal. The power source of this differential amplifier U1 is supplied by the zener diodes D6 and D9.

V_{ref} is the variable reference voltage for constant voltage control, and the V_{ref} voltage (0-10 V) is output between the rear terminals ③ - ⑤ from U3 (2/2), VR1 VOLTAGE.

I_{ref} is the variable reference voltage for constant current control, and the V_{ref} voltage (0-10 V) is output to the rear terminals ⑧ - ⑪ from U3 (1/2), VR2 CURRENT.

3. VOLTAGE/CURRENT CONTROL CIRCUIT (See Fig. 2)

With the floating type of voltage control, the control circuit is controlled using the +OUT terminal as a reference GND. The GND of the control power source ± 15 V ($\downarrow V_G$) is therefore of equal potential to the +OUT terminal.

The +OUT terminal voltage and a voltage divided by the voltage detecting resistors R42 and R43 are applied to the voltage control feedback amplifier U4.

Both input terminals of U4 are operated to keep the same potential.

The output from the feedback amplifier U4 goes through D26, is amplified by Q12 and Q13, passes through Q7 (Y87), and drives the base of the next stage current amplification circuit Q1, 3, 5. The voltage at both ends of the constant current detecting resistor R10 (0.036 ohms, 40 W) is used as a reference for the next constant current operation.

This point is the GND during constant current operation, is indicated by $\downarrow I_G$ on the circuit diagram, and becomes the reference point.

When the output current I_o flows, the voltage produced in the current detecting resistor R10 is applied to the control amplifier U5. The voltage divided to I_{ref} voltage feedback by R45 and R46 is applied to U5.

When the voltage at both ends of R10 exceeds this divided voltage (R45 and R46), U5 is operated to drive as the constant current through D27.

The output from U5 drives Q1, 3, 5 (series regulators) through the same route as during constant voltage operation. When the current exceeds the constant current setting value, the operation of the feedback amplifier circuit U4 is simultaneously stopped, and the D26 route is interrupted. Namely D26 and D27 are control OR circuits.

4. METER CIRCUIT

The voltmeter indicating circuit detects voltage from the +OUT terminal, which goes through U2 (2/2) (X77), the OVP CHECK S3b switch, U6 (1/2) (X73), the OUTPUT ON/OFF switch, the V/I CHECK switch, meter amp U7 (2/2) and is applied to the voltmeter.

During V/I CHECK operation, the V_{ref} voltage is applied directly to the meter amp U7 (2/2).

The voltage detected by the current detecting resistor R10 for the ammeter circuit goes through the V/I CHECK switch and is applied to the ammeter amp U7 (1/2).

During V/I CHECK, the I_{ref} voltage is applied directly to the meter amp U7 (1/2). Q1, 3, 5 (series regulators) are controlled by Q10, Q12, Q13 (X73) and Q7 (Y86), by operating the OUTPUT ON/OFF switch, to turn output voltage ON and OFF.

5. OVP CIRCUIT AND OCP CIRCUIT

The D5 (zener diode) (X77) reference voltage that is divided with VR1 and the +OUT terminal voltage divided by R3, R4 is applied to the OVP voltage detecting comparator U1 (1/2) (X77). When the output voltage exceeds the voltage setting of VR1 (OVP setting VR), the output of U1 is inverted. The inverted output goes through D8, Q1 and D9, drives thyristor D10 and turns the breaker switch S1 (APG4) OFF.

The reference (GND) of the OVP circuit is the same as the +OUT terminal V_G of the voltage control circuit.

The detecting voltage generated by the current detecting resistor R10 and the reference voltage of D28 (zener diode) (X73) is applied to the OCP current detecting comparator U6 (2/2) (X73).

If an excessive amount of current flows (overcurrent), the output of U6 (2/2) is inverted, it goes through D7, Q1 and D9 to drive the thyristor D10 and turns the breaker switch S1 (APG 4) OFF.

CIRCUIT DESCRIPTION

Furthermore, the thermal relay provided on the heat sink to prevent overheating of the series regulator transistor detects abnormal temperature rise, and turns the breaker switch S1 OFF through D6. (X77-1400)

The OVP circuit, OIP circuit and overheating prevention protective circuit drive the breaker switch S1 with the OR circuit that consists of D6, D7 and D8. (X77-1400)

6. PHASE CONTROL CIRCUIT (X73-1680)

The PD series power source features a phase control circuit to control the thyristors D1 and D2 (X81-1590) of the main power source rectifying bridge, in order to minimize power loss of the series control transistors (Q1, 3, 5) by maintaining the voltage between the Q1, 3, 5 collectors and emitters, regardless of load. The GND of this phase control circuit consists of the emitter of the series control transistors Q1, 3, 5, with an independent floating circuit from the unit power source.

A stable ± 15 V is generated for the phase control circuit power source by U10 and U11. A sawtooth wave that is synchronized with the AC power source line is generated by D42, D43 and U12. This sawtooth wave is applied to U13 (2/2). (See Fig. 3)

The collector voltage (V_{CE} detecting voltage) of the series control transistor is applied to the error amplifier U13 (1/2). The DC voltage of U13 (1/2) is added to the sawtooth wave of U12 (2/2) and applied to the input of U13 (2/2). The pulse width modulated (PWM) output of U13 (2/2) is finely differentiated by C64, etc., to drive the one shot multi U14.

The output of U14 (trigger gate pulse) is separated from the GND of the phase control circuit, and amplified by Q22 and Q23 to drive the thyristors (D1 and D2).

Note: GND indication of respective circuits

Case 	Unit GND (Case or Chassis)
V_G 	Voltage control circuit GND
I_G 	Current control circuit GND (one end - point "a" of current detecting resistor R10)
	Phase control circuit GND (emitter point of series control transistors Q1-Qn)

Caution:

Do not short the insulation to the GND of the respective circuits when repairing breakdowns.

This may result in burning of the wiring and/or printed circuit board.

7. DPM UNIT (D type only)

The digital panel meter unit consists of the voltage indicator circuit and current indicator circuit, which both function the same electrically.

U1 (U31) is the 3-1/2 digit indication A/D converter, with a 7 segment LED driver incorporated. U2 (U32) generates the reference voltage.

The optimum value is set with VR1 (VR31), and VR2 (VR32) is for full scale adjustment. The A/D converter is provided with an external circuit constant to enable full scale indication of 1999 when 1.999 V is input, regardless of voltage indication, current indication and type of unit. Namely, these circuit constants are R1 (R31), C3 (C33), C4 (C34) and C5 (C35).

The main amp output of the amp unit (X73) is fed to the attenuator which consists of R20 (R50) and the amp unit R81 (R73). Voltage indication is 3-1/2 digits, but a 2nd attenuator is provided for 2 step auto range in case of indication 20 V or higher. When the indication in the U3 circuit exceeds 1999, a range up signal is output, and a range down signal is output when the indication is 1000 or lower. This signal is latched to the RS flip flop which comprises U4, is passed through Q1, Q2 and drives the decimal point LED. Simultaneously, Q3 drives the analog switch Q4.

Since the ground levels for the meter output of the voltage and current are different, the respective power supplies are isolated.

CIRCUIT DESCRIPTION

PRINCIPLE OF THE FLOATING REGULATOR

Vref: Reference voltage at CV
Iref: Reference voltage at CC
VG: Ground at CV
IG: Ground at CC

The output voltage at CC operation

$$V_o = -\frac{R_2}{R_1} V_{ref}$$

The output current at CC operation

$$I_o = \frac{K}{R_s} I_{ref} \text{ (where } K = \frac{R_4}{R_3 + R_4} \text{)}$$

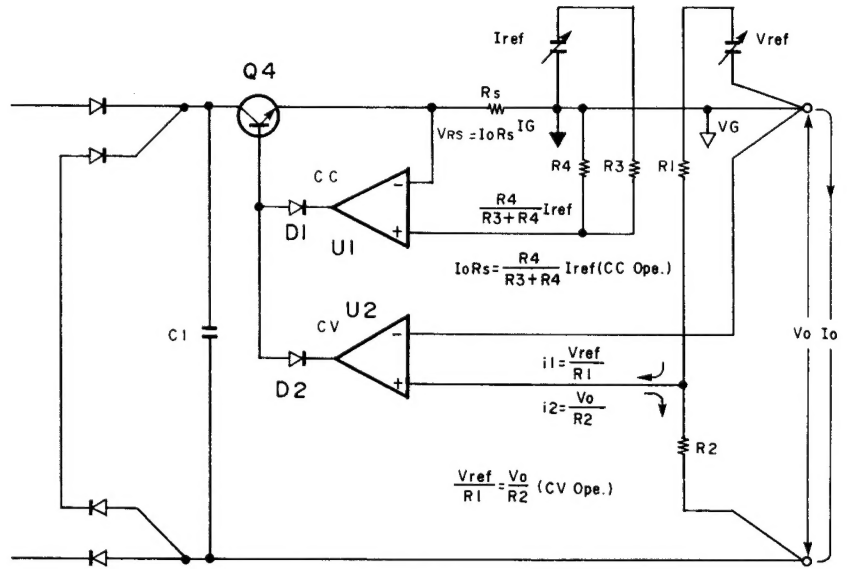

Fig. 2 With the PD series, the constant output voltage and current are obtained by changing the Vref and Iref.

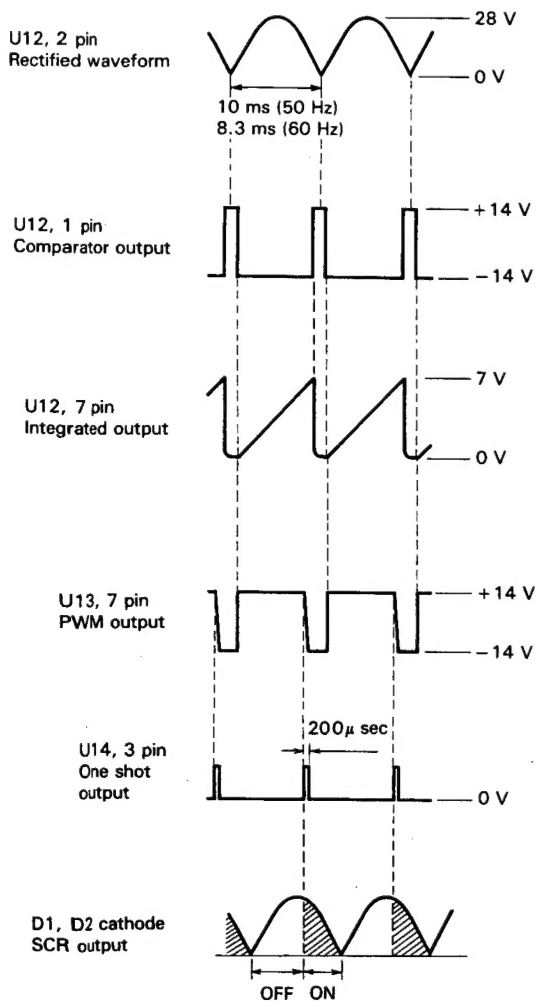

Fig. 3

ADJUSTMENT

ADJUSTMENT

To obtain the best performance, periodically calibrate the unit. Sometimes, only one mode need be calibrated, while at other times, all modes should be calibrated.

When one mode is calibrated, it must be noted that the other modes may be affected

When calibrating all modes, perform the calibration in specified sequence. The following calibration required an accurate measuring instrument and an insulated adjusting flat blade screwdriver.

For optimum adjustment, turn the power on and warm up this equipment sufficiently (more than 30 minutes) before starting.

Before calibrating the unit, check the power supply voltage and the zero of the voltmeter and ammeter.

TEST EQUIPMENT REQUIRED

The following instrument or their equivalent should be used for making adjustment.

Multimeter	8810A	FLUKE
Oscilloscope	CS-5165	KENWOOD

PREPARATION FOR ADJUSTMENT

1) The control and switch settings listed below should be used for each adjustment procedure.

Exceptions to these setting will be noted as occur.

2) Power cord should be correctly connected.

3) Short bar should be connected as follows.

⊕ - ⊕S, ⊖ - ⊖S, ① - ②, ③ - ④, ⑥ - ⑦, ⑧ - ⑨, ⑩ - ⊖ (on the front panel)

4) Heat sink should be insulated with respect to the chassis.

5) Unless otherwise specified, set each control as follows after completion of each adjustment.

POWER	ON
VOLTAGE	Maximum counterclockwise position
CURRENT	Maximum counterclockwise position
OUTPUT	OFF (■)
V/I CHECK	OFF (■)
OVP CHECK	OFF (■)
OVP adj. control	Maximum clockwise position

Item	Control and setting	Test Equip.	Adj. Control	Specifications	Procedure
C1 Voltage check		8810A		Less than 10V	Connect a multimeter to measure the voltage between C1 (+ side) and (- side).
± 15V check		8810A		± 15V ± 0.5V	Connect a multimeter to measure the voltage between OUTPUT (⊕) on the front panel and ± 15V test points on the AMP unit, respectively.
V _{CE} voltage coarse	VOLTAGE; maximum clockwise position CURRENT; maximum clockwise position	8810A	VR20	Approx 4.5V	Connect a multimeter to measure the voltage between collector and emitter of the transistor on the heat sink. See Fig. 4.
V _{REF} offset	OUTPUT; OFF VOLTAGE; minimum counterclockwise position CURRENT; maximum clockwise position	8810A	VR2	0V ± 0.5mV	Connect a multimeter between OUTPUT terminal ⊕S and control terminal NO.3 on the rear panel.
V _{REF} gain	VOLTAGE; maximum clockwise position CURRENT; maximum clockwise position	8810A	VR1	10.25V ± 0.03 V	Connect a multimeter between OUTPUT terminal ⊕S and control terminal NO.3 on the rear panel.
V meter offset	VOLTAGE; minimum counterclockwise position CURRENT; maximum clockwise position		VR8	0V D type; 0V ± 0V	Make adjustment while observing the V meter on the front panel.

ADJUSTMENT

Item	Control and setting	Test Equip.	Adj. Control	Specifications	Procedure
V OUT offset	OUTPUT; ON VOLTAGE; minimum counterclockwise position CURRENT; maximum clockwise position		VR11	0 V D type; 0 V \pm 0 V	Make adjustment while observing the V meter on the front panel.
V meter gain	CURRENT; maximum clockwise position V/I CHECK; OFF	8810A	VR7	Specified voltage(full scale) D type; specified voltage \pm 1 digit	Connect a multimeter between OUTPUT terminal \oplus and \ominus on the front panel. Rotating the VOLTAGE control to indicate specified voltage range on the multimeter. Make adjustment while observing the V meter on the front panel.
V check	OUTPUT; ON CURRENT; maximum clockwise position V/I CHECK; ON	8810A	VR5	Specified voltage (full scale) D type; specified voltage \pm 1 digit	
I _{REF} offset	OUTPUT; ON VOLTAGE; maximum clockwise position CURRENT; minimum counterclockwise position	8810A Load (1) Current detecting resistor	VR4	10mV \pm 1mV	Connect the multimeter between control terminal NO.8 and NO.11 on the rear panel.

C71	NO USED	10 μ 25V
R73	18 Ω 1/5W	0 Ω
R81	18 Ω 1/5W	0 Ω
VR7	5k Ω B	3k Ω B
VR9	5k Ω B	3k Ω B

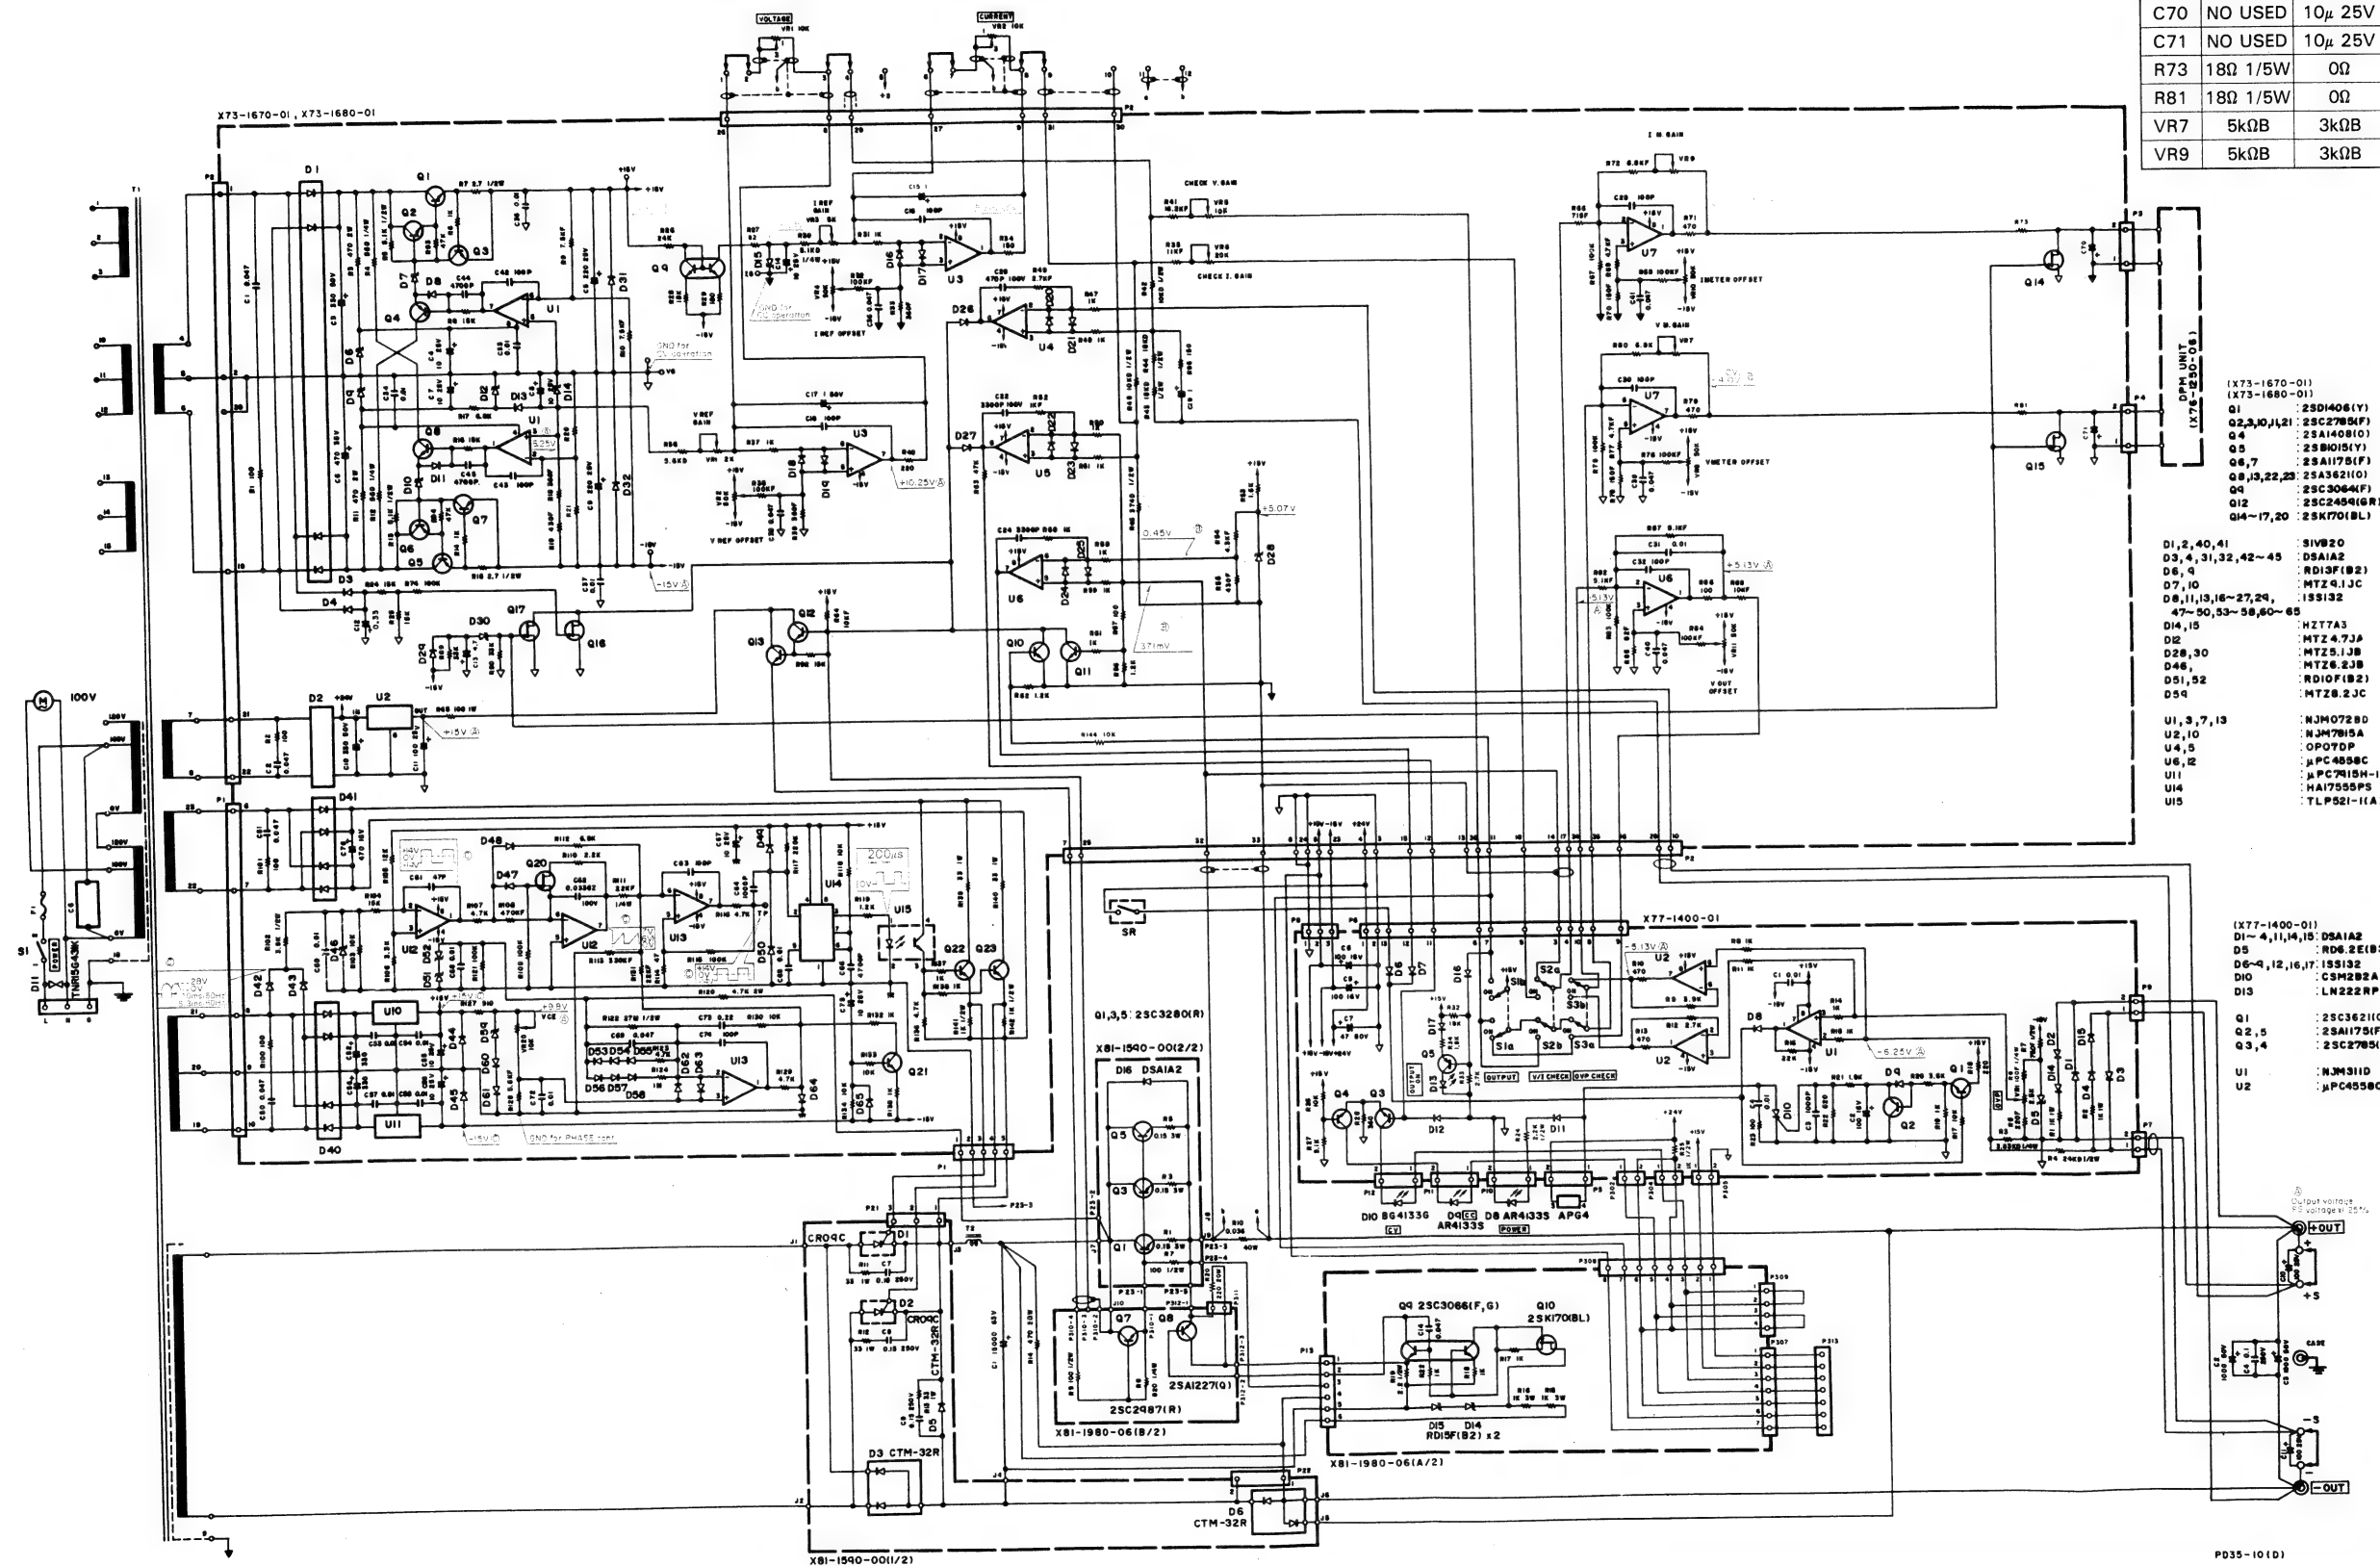

CAUTION 1: Condition of measurement.
CC VR \rightarrow MAX.
CV VR \rightarrow MAX.
OUTPUT \rightarrow OPEN
OVP VR \rightarrow MAX.
At measurement, the DMM GND line is the + output terminal (Front panel \oplus or rear panel \oplus).
(In the circuit diagram, indicated with "a").

CAUTION 2: Condition of measurement.
CC VR \rightarrow MAX.
CV VR \rightarrow MAX.
OUTPUT \rightarrow SHORT
OVP VR \rightarrow MAX.
At measurement, the DMM GND line is the rear panel terminal board No. 11 (in the circuit diagram, connected to point "a").

CAUTION 3: Condition of measurement.
CC VR \rightarrow MAX.
CV VR \rightarrow MAX.
OUTPUT \rightarrow OPEN
OVP VR \rightarrow MAX.
GND for PHASE control (GND for checking the phase control circuit; (emitter of Q1-Q6))
